

Computer-aided manufacture (CAM) and rapid prototyping

CAM:

- Automated machinery is controlled by software to manufacture physical parts
- CAM uses Computer numerical control (CNC) and CAD files to generate 3D tool paths for the machinery to follow
- CAM machines include laser cutters, embroidery machines, NC milling machines, routers and lathes

<i>Advantages</i>	<i>Disadvantages</i>
<ul style="list-style-type: none">• Very accurate/eliminate human error• Repetitive accuracy• Save and reload drawings to suit demand• High speed/can run 24/7• Reduced labour costs• Increased health and safety	<ul style="list-style-type: none">• High set up costs• Training people to use it is difficult• Low worker morale• High skilled engineers need to be employed• Can't detect faults easily

CNC:

<i>Advantages</i>	<i>Disadvantages</i>
<ul style="list-style-type: none">• Can run 24/7• Designs can be manufactured many times• Less skilled employees needed• CNC can be improved through updates• Reduced labour costs• Repeatable accuracy	<ul style="list-style-type: none">• High set up cost• Increased unemployment• Old skills lost

CNC lathes:

- Used to cut away material from objects in complex design

<i>Advantages</i>	<i>Disadvantages</i>
<ul style="list-style-type: none">• Will cut range of materials• Repeatability of design• Easy to use/learn• Can run 24/7• Can automatically change tools to complete different tasks	<ul style="list-style-type: none">• Takes time to clamp down material• Tools need changing when blunt• Cutting fluid required• Swarf (of cutting)• Expensive to set up

Uses: Table legs door handles

CNC router:

- Used to cut sheet material that are too thick for the laser cutter

<i>Advantages</i>	<i>Disadvantages</i>
<ul style="list-style-type: none">• Cuts a range of materials• Repeatability of design• Safer than traditional method• Less waste than traditional method• Able to run for softer materials such as foam	<ul style="list-style-type: none">• Takes time to clamp material• Tools need changing as they become blunt• Requires cutting fluid• Swarf• Material can crack

Uses: To cut out foam (laser can't), cut materials too thick for laser

CNC milling:

- Similar to routers but for metal, cuts grooves/holes/angles into metal work

<i>Advantages</i>	<i>Disadvantages</i>
<ul style="list-style-type: none">• Will cut range of materials• Repeatability of design• Easy to use/learn• Can run 24/7• Can automatically change tools to complete different tasks	<ul style="list-style-type: none">• Takes time to clamp down material• Tools need changing when blunt• Cutting fluid required• Swarf (of cutting)• Expensive to set up

Uses: Drilling, routing

CNC laser cutting:

- Cut complex shapes in a wide range of materials (paper, polymers, timber, metals, textile)

<i>Advantages</i>	<i>Disadvantages</i>
<ul style="list-style-type: none">• Clean edge finish• Increased accuracy• No wear and tear on tools• Easy to set up• Can produce repeat designs	<ul style="list-style-type: none">• Energy intensive• Expensive• Leave burn marks/some materials catch on fire• Does not work for all materials• Inconsistent production times

Uses: Engraving, cutting material size

CNC vinyl cutter:

- Image designed on CAD
- Peel of background
- Low tack film cut out
- Mark out surface

- Apply image to surface
- Remove low tack

<i>Advantages</i>	<i>Disadvantages</i>
<ul style="list-style-type: none"> • Good for low production • Resistant to moisture • Affordable/durable • Can produce bright colourful images 	<ul style="list-style-type: none"> • Loss of jobs for skilled sign writers • Waste from weeding is not recyclable • Not completely flat

Uses: Posters, wallpapers

Rapid prototyping (3D printing):

- Models made using computer-based technology such as a 3D printer

<i>Advantages</i>	<i>Disadvantages</i>
<ul style="list-style-type: none"> • Fast process with minimal human input • Can be done cheaply/quickly • 3D models can be made to check for errors • Can be used for marketing pictures • Designers can evaluate design • Avoids high cost of errors in final production • Prototypes are made faster/work through the night/24/7 • Prototypes are made more accurately/higher quality/reduced errors • Prototypes can be more complex/intricate/finely detailed • Changes/edits are easier to produce • More modifications/variations can be considered • Better testing/analysis/ /decisions made 	<ul style="list-style-type: none"> • Not as quick as some methods • Can only make small scale designs • Need specific polymer for specific 3D printing machine

<ul style="list-style-type: none">• Improved outcomes are developed• Reduced development time/time to market/meet customer demand/satisfaction/increased competitiveness• Saves money (due to reduced labour/materials/energy/resources)	
--	--

Uses: Making prototypes of designs
